## Use a media query to change a variable

CSS Variables can simplify the way you use media queries.

For instance, when your screen is smaller or larger than a query break point, you can change the value of a variable, and it will apply to all the styles using that variable.

In the `:root` selector of the media query, change the `--penguin-size` variable to a value of `200px`. Also, redefine `--penguin-skin` and give it a value of `black`. Then resize the preview to see this change in action.

:root should reassign the --penguin-skin variable to black.
